

Science done well

Astronomy 101
Syracuse University, Fall 2022
Walter Freeman

October 13, 2022

Today:

- Finishing the conversation about science and pseudoscience
- Introducing your paper
- Review for Exam 2

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)
- How we discovered that the Sun is at the center of the Solar System

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)
- How we discovered that the Sun is at the center of the Solar System
- Kepler's laws of orbits (including the third law, from Lab 6)
 - Homework 4 and the exercise on Kepler's laws

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)
- How we discovered that the Sun is at the center of the Solar System
- Kepler's laws of orbits (including the third law, from Lab 6)
 - Homework 4 and the exercise on Kepler's laws
- The laws of universal gravitation and motion (last class)
 - We did an exercise on this as well

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)
- How we discovered that the Sun is at the center of the Solar System
- Kepler's laws of orbits (including the third law, from Lab 6)
 - Homework 4 and the exercise on Kepler's laws
- The laws of universal gravitation and motion (last class)
 - We did an exercise on this as well
- The properties and process of science (today)

Announcements - exam next Tuesday

Exam 2 is next Tuesday. I've posted a study guide. The exam will cover:

- The lab on parallax (the broad idea, not calculations)
- How we discovered that the Sun is at the center of the Solar System
- Kepler's laws of orbits (including the third law, from Lab 6)
 - Homework 4 and the exercise on Kepler's laws
- The laws of universal gravitation and motion (last class)
 - We did an exercise on this as well
- The properties and process of science (today)
- The conservation of energy (Thursday)
 - There will be an exercise on this, too

Exam format

The exam will contain:

- Thirteen multiple choice questions, emphasizing the emergence of heliocentrism
- Three free-response questions:
 - One question on Kepler's laws of orbits
 - One question on the law of gravity
 - One question on the process of science, where you will need to write a paragraph in response to a prompt

As before, you may use one page of notes, front and back.

The nature of science

In this unit we have taken a look at a series of revolutions that showed us the true nature of the solar system.

But they also merged disciplines that had been separate since the time of the Greeks:

- Natural philosophy: “what is the truth of Nature?” (truth-seeking)
- Astronomy: “Where can I find Mars next week?” (practical applications)

Newton brought us into the age of *astrophysics* – possibly the first true *science*.
What’s that mean?

The scientific method

- “Huh, that is interesting – I wonder how it works?”
- Develop a *model*: a picture that explains as much as you can
- Compare the predictions of your model to real-world observations

The scientific method

- “Huh, that is interesting – I wonder how it works?”
- Develop a *model*: a picture that explains as much as you can
- Compare the predictions of your model to real-world observations
 - Partial agreement: can we refine the model? (Copernicus)
 - Complete disagreement: Tear it up and go back to (1)
- Model agrees with observations so far: It’s a useful *theory*

The scientific method

- “Huh, that is interesting – I wonder how it works?”
- Develop a *model*: a picture that explains as much as you can
- Compare the predictions of your model to real-world observations
 - Partial agreement: can we refine the model? (Copernicus)
 - Complete disagreement: Tear it up and go back to (1)
- Model agrees with observations so far: It’s a useful *theory*
- Does the model predict new things not yet observed?
- Design observations to test for them (experiments!)
 - Partial agreement: can we refine the model?
 - Complete disagreement: Tear it up and go back to (1)

The scientific method

- “Huh, that is interesting – I wonder how it works?”
- Develop a *model*: a picture that explains as much as you can
- Compare the predictions of your model to real-world observations
 - Partial agreement: can we refine the model? (Copernicus)
 - Complete disagreement: Tear it up and go back to (1)
- Model agrees with observations so far: It’s a useful *theory*
- Does the model predict new things not yet observed?
- Design observations to test for them (experiments!)
 - Partial agreement: can we refine the model?
 - Complete disagreement: Tear it up and go back to (1)
- Body of supporting evidence grows
- Continually seek to expand the *scope* of the model with more observations

Properties of science

Broad properties of science:

- **Empiricism:** the ultimate authority is what we measure about the world around us, not what we think.
- It is vitally important that the conclusions we *claim* come from our data actually do
- There's a whole field of math dedicated to data analysis: *statistics*. It has to be done honestly and well!

Properties of science

Broad properties of science:

- **Empiricism:** the ultimate authority is what we measure about the world around us, not what we think.
- It is vitally important that the conclusions we *claim* come from our data actually do
- There's a whole field of math dedicated to data analysis: *statistics*. It has to be done honestly and well!
- **Self-skepticism:** someone making a scientific claim should actively search for things that might prove themselves wrong
- Potentially refuting arguments/evidence are a *good* thing

Properties of science

Broad properties of science:

- **Empiricism:** the ultimate authority is what we measure about the world around us, not what we think.
- It is vitally important that the conclusions we *claim* come from our data actually do
- There's a whole field of math dedicated to data analysis: *statistics*. It has to be done honestly and well!
- **Self-skepticism:** someone making a scientific claim should actively search for things that might prove themselves wrong
- Potentially refuting arguments/evidence are a *good* thing
- **Universality:** the laws of nature apply in all places and times, and to all things (including humans)
- Since the laws of nature are universal, they form a coherent whole
- Any new finding must find its place alongside preexisting measurements and principles
- Very rarely previously-accepted things get overturned; more often they are *extended*

Properties of science

Broad properties of science:

- **Empiricism:** the ultimate authority is what we measure about the world around us, not what we think.
- It is vitally important that the conclusions we *claim* come from our data actually do
- There's a whole field of math dedicated to data analysis: *statistics*. It has to be done honestly and well!
- **Self-skepticism:** someone making a scientific claim should actively search for things that might prove themselves wrong
- Potentially refuting arguments/evidence are a *good* thing
- **Universality:** the laws of nature apply in all places and times, and to all things (including humans)
- Since the laws of nature are universal, they form a coherent whole
- Any new finding must find its place alongside preexisting measurements and principles
- Very rarely previously-accepted things get overturned; more often they are *extended*
- **Objectivity:** scientific ideas, or the evaluation of them, should be independent of any particular human perspective
- Science is not about *you* (whoever you are)
- Criticism of other people's ideas isn't about them, either

Properties of science, in our story

Science – as a means of seeking truth – has a few fundamental properties:

- **Empiricism:** the ultimate authority is what we measure about the world around us, not what we think.
- Ultimately we must build our understanding of the world from what we measure – how the stars, Sun, and planets appear to move
- This is different from the old Greek natural philosophy, that valued *pure thought* over the dirty work of *measuring things*
- **Self-skepticism:** someone making a scientific claim should actively search for things that might prove themselves wrong
- This is very hard to do, but ultimately profitable, as we'll see in the next story

Properties of science, in our story

Science – as a means of seeking truth – has a few fundamental properties:

- **Universality:** the laws of nature apply in all places and times, and to all things (including humans)
- Newton’s big idea: $F = ma$ explains all motion, in space and on Earth, in the same way
- This was different from the previous belief that matter on Earth worked one way, and matter in space worked a different way
- **Objectivity:** scientific ideas, or the evaluation of them, should be independent of any particular human perspective
- What will we *fail* to learn if we only observe from Syracuse?
- This is why we were “stuck” with geocentrism for so long...

Science doesn't attempt to answer everything, only:

- ... what is the Universe made of?
- ... how does it work?
- Questions like: “if I do this, what will happen?”

Science doesn't attempt to answer everything, only:

- ... what is the Universe made of?
- ... how does it work?
- Questions like: “if I do this, what will happen?”

It doesn't address questions like...

- “What *should* we do here?”
- “What does it mean to be a good person?”

Science doesn't attempt to answer everything, only:

- ... what is the Universe made of?
- ... how does it work?
- Questions like: “if I do this, what will happen?”

It doesn't address questions like...

- “What *should* we do here?”
- “What does it mean to be a good person?”
- “How should we imagine our place in the world?”

Science doesn't attempt to answer everything, only:

- ... what is the Universe made of?
- ... how does it work?
- Questions like: “if I do this, what will happen?”

It doesn't address questions like...

- “What *should* we do here?”
- “What does it mean to be a good person?”
- “How should we imagine our place in the world?”

What we learn from science *does* influence our answers, though!

Principles that come from these:

These things are difficult and many honest scientists (meaning: anyone who talks about the natural world) slip up. These principles are safeguards to protect us from being too convinced of things that are not true. But it is possible to be a good, honest scientist, and make mistakes.

Of course, it is also possible to be dishonest: to intentionally warp the process of science to convince people of things that are not true.

We'll study “science done poorly” later.

Principles that come from these:

Empiricism: A model is only valid within the realm of data against which it has been checked.

- **Precision:** is the law of gravity valid to one part in a billion? One part in a trillion?
 - “Equivalence” (all objects fall at the same rate in a vacuum): holds to one part in 10^{17}
 - Universal gravitation: **Not quite true in regions of strong gravity!**
 - Conservation of energy: seems absolutely solid, from fragments of an atom to black holes
- **Scope and scale:** Is Newtonian mechanics valid for very fast things? Things as large as a galaxy? Things as small as an atom?
 - Very fast things: **not quite**, since close to the speed of light space and time get mixed up
 - Very large things: Yes, things as large as galaxies and beyond (but this requires dark matter)
 - Very small things: **no**, since quantum mechanics changes definitions of “position”

Principles that come from these:

Empiricism: A model is only valid within the realm of data against which it has been checked.

- **Precision:** is the law of gravity valid to one part in a billion? One part in a trillion?
 - “Equivalence” (all objects fall at the same rate in a vacuum): holds to one part in 10^{17}
 - Universal gravitation: **Not quite true in regions of strong gravity!**
 - Conservation of energy: seems absolutely solid, from fragments of an atom to black holes
- **Scope and scale:** Is Newtonian mechanics valid for very fast things? Things as large as a galaxy? Things as small as an atom?
 - Very fast things: **not quite**, since close to the speed of light space and time get mixed up
 - Very large things: Yes, things as large as galaxies and beyond (but this requires dark matter)
 - Very small things: **no**, since quantum mechanics changes definitions of “position”
- **Universality** helps with this, but we have to be careful
 - We don’t need to drop every rock off a cliff to understand projectile motion...
 - ... but it’s hard to know exactly what limits we have to probe

Principles that come from these:

Self-skepticism: It's the duty of the claimer to search for experiments that they can do to possibly prove themselves wrong.

- “Neutrinos faster than light”
- The caution of LIGO after their Nobel Prize-winning discovery

Principles that come from these:

Self-skepticism: It's the duty of the claimer to search for experiments that they can do to possibly prove themselves wrong.

- “Neutrinos faster than light”
- The caution of LIGO after their Nobel Prize-winning discovery
- The most powerful evidence for an idea is an experiment that will produce something unexpected if you're right, but can conclusively disprove your idea if you're wrong

Principles that come from these:

Self-skepticism: It's the duty of the claimer to search for experiments that they can do to possibly prove themselves wrong.

- “Neutrinos faster than light”
- The caution of LIGO after their Nobel Prize-winning discovery
- The most powerful evidence for an idea is an experiment that will produce something unexpected if you're right, but can conclusively disprove your idea if you're wrong
- These experiments need to be as diverse as possible: this is hard, since you have to check things you're not familiar with

Science: a powerful, corruptible tool

This synergistic enterprise has been behind a vast amount of progress for humanity in the last 350 years.

As with anything powerful, this process can be corrupted.

Your paper will involve analyzing an incident where it has been.

Let's look at how that can happen.

Please feel free to chime in with your own examples.

I'd like to spend much of the time today “off script” – talking about your examples, rather than my slides.

I'll also be steering clear of any topics that are “hot-button”. Feel free to write about these in your papers! But I won't be using them as examples here: climate change, creationism, vaccination, drug laws...

“Scientific integrity” is not a reference to the usual sort of integrity – to being a good, honest person.

It is possible to do horrible things in the process of research, but do research that is well-grounded and draws correct conclusions.

It is also possible to be an honest, diligent scientist and make mistakes, and come to incorrect conclusions because of flaws in the application of the scientific process. (I have done this myself.)

Two notes

“Scientific integrity” is not a reference to the usual sort of integrity – to being a good, honest person.

It is possible to do horrible things in the process of research, but do research that is well-grounded and draws correct conclusions.

It is also possible to be an honest, diligent scientist and make mistakes, and come to incorrect conclusions because of flaws in the application of the scientific process. (I have done this myself.)

There is a difference between a flawed process of science and simply being wrong. We aren't talking about math errors or physics mistakes here.

There is a difference between a flawed process of science and being a terrible person, too. We aren't talking about experiments that hurt their subjects, either.

Cherry-picking and biased data

One example of how this goes wrong: **cherry-picking**.

A strict definition: Using limited, biased data that will give you a biased **result**, accidentally or intentionally

Example: The US Army Air Corps trying to use science to avoid getting airplanes shot down in World War II...

Cherry-picking, examples

Here's a map of a flat earth from the Flat Earth Wiki (ugh).

The distances are more or less right for the Northern Hemisphere...

PeteSvarrior, for the Flat Earth Wiki; cc-by-sa.

Cherry-picking, examples

Here's a map of a flat earth from the Flat Earth Wiki (ugh).

The distances are more or less right for the Northern Hemisphere...

They're completely absurd for the Southern Hemisphere!

Clearly no Flat Earthers asked any Argentinians how far it was to New Zealand...

PeteSvarrior, for the Flat Earth Wiki; cc-by-sa.

Cherry-picking, examples: reporting bias

$p > 0.05$: “whatever we found, there’s more than a 5% chance that it is just a coincidence”

Cherry-picking, examples: reporting bias

Cherry-picking, examples: reporting bias

Cherry-picking, examples: reporting bias

xkcd #882, by Randall Munroe: cc-by-nc.

Laundering data through statistics: dangerous!

Reporting only an interesting/profitable/exciting piece of data, and ignoring the rest, leads to flawed conclusions!

This is particularly worrying in medical research.

Do you have any favorite examples of biased data causing flawed conclusions?

Common fallacies: ad hominem arguments

An ad hominem argument is one that condemns someone else's argument because of *who* they are, not the content of their logic.

A few types (paraphrased):

Conspiracy-type reasoning (false allegations of ulterior motives):

- “NASA faked the moon landings because they wanted to cover up the fact that their rockets didn’t work”
- “The anti-smoking campaign is there to make money, and also something something Nazis” (<http://www.smokingaloud.com>)
- “They just *say* that fluoride helps dental health but it’s really a Communist plot”

Arguments based on status or identity:

- “That person is an esteemed expert; we must trust them without question!”
 - Four out of five dentists recommend such-and-such brand of toothpaste...
- “That person is a nobody; how could they have any good ideas?”
- “That person is a member of race/religion/gender/political party XYZ, how could they have anything right to say?”

Ad hominem arguments

Ad hominem (Latin: “against the person”) arguments fail the scientific standard of *objectivity*: claims should be evaluated based on data and logic, not on who is making them.

False claims of ulterior motives are a common sort of *ad hominem* attack.

Ad hominem arguments

Ad hominem (Latin: “against the person”) arguments fail the scientific standard of *objectivity*: claims should be evaluated based on data and logic, not on who is making them.

False claims of ulterior motives are a common sort of *ad hominem* attack.

... and using “argument from authority” is the reverse: well, if these doctors say that they smoke Camels, they must be safe... right?

Sometimes deliberately deceptive people really *do* have ulterior motives. This can be a warning sign that someone is being deceptive...

Do you have any favorite examples of arguments from authority or arguments *ad hominem*?

Ignoring refuting evidence

Self-skepticism is a hallmark of sound science. Good scientists report:

- Any experimental evidence that might conflict with their proposal
- All of the possible flaws that *they* thought of in their claim
 - ... and how they considered them
- Any tests that anyone *else* could do to try to disprove them
- All the things that make them **uncertain** about their result
- The limits of their conclusions

Most good scientific writing spends much of its time doing the above. You should only try to convince other people you are right once you have tried very hard, yet failed, to prove yourself wrong.

Any claimant that spends most of their time talking *up* their conclusions is likely suspect.

Ignoring potentially refuting evidence

Ignoring or failing to search for refuting evidence is a common trait of faulty scientific process. This can either be:

- Ignoring refuting evidence altogether, even if it's widely known
- Dismissing refuting evidence out of hand, without considering it in any real way
- Failing to think of potentially refuting evidence and search for it

Do you have any favorite examples of flawed scientific claims that fail to address potentially refuting evidence?

https://wiki.tfes.org/Flat_Earth_-_Frequently_Asked_Questions

Manufacturing a controversy

We've discussed some of the common features of people *advancing scientific claims* incorrectly, negligently, or dishonestly.

Sometimes dishonest people aren't trying to *advance* something they know to be false, though.

They're more interested in convincing people to *reject* something that is true.

To do that, they only need to create doubt. This is commonly done by *manufacturing a controversy*.

Manufacturing a controversy

We've discussed some of the common features of people *advancing scientific claims* incorrectly, negligently, or dishonestly.

Sometimes dishonest people aren't trying to *advance* something they know to be false, though.

They're more interested in convincing people to *reject* something that is true.

To do that, they only need to create doubt. This is commonly done by *manufacturing a controversy*.

(This is a common tactic to erode trust in *anything*, not just science – common in politics and negative advertising)

Manufacturing a controversy

Do you have any favorite examples of manufactured controversies?

Manufacturing a controversy

Do you have any favorite examples of manufactured controversies?

Consider again the tobacco industry:

- “Secondhand smoke doesn’t cause health problems; those studies are wrong”
- “Are you really sure that secondhand smoke causes health problems? Maybe it was building ventilation!”

One of these is a far easier sell than the other!

The industry’s strategy does not require winning the debates it manufactures. It is enough to foster and perpetuate the illusion of controversy in order to muddy the waters around scientific findings that threaten the industry. Thus it offers reassurance to smokers, helping them to rationalize and repress their health concerns. Furthermore, claims of “not proven” resonate with friendly or naive journalists and governments, and provide an excuse for not taking strong governmental or societal action against tobacco.

—Yussuf Saloojee and Elif Dagli, “Tobacco industry tactics for resisting public policy on health” Bull. World Health Organ. 78(7): Geneva, July 2000.

Two things are both true:

- Some scientific findings can dramatically change our lives and our perspective on the world, and are compelling and exciting
- Whether a scientific claim is true or not doesn't depend on whether it's exciting or not (objectivity)

Scientists thus have twin duties:

- They should engage with society in sharing the excitement and interest of their findings. Science communication is vital (and many of us are bad at it; the astronomers do better than the physicists!)
- They should **separate this excitement** from the task of **evaluating the validity of claims**

Beware of any sort of scientific claim that conflates **the evidence that it is true** with **why you should be excited by it**, or that seems to be hyped by its claimant.

Good scientists do hold press conferences, because many discoveries are exciting!

But these happen only in the context of:

- a vast amount of self-skepticism applied to their results first
- objective, sober presentation of the *evidence* for their conclusions

Often people adopt the trappings of science to give nonscientific ideas a veneer of validity. This is called “pseudoscience” – fake science.

Science

- Universal models
- Natural principles
- Testable predictions
- Not anthropocentric
- Replicable results
- Self-skepticism

Pseudoscience

- Singular events
- Supernatural explanations
- Untestable predictions
- Different rules for people
- Results defy replication
- Self-promotion
