

ASTRONOMY 101 EXAM 1 FORM CD-KEY

Name: _____

Lab section number: _____

(In the format “M0**”. See back page; if you get this wrong you may not get your exam back!)

- Exam time: one hour and twenty minutes
- Please put bags under your seats to allow proctors to move around the room.
- Please choose the **best** answer to each question.
- You may use only pencils and pens for this exam; no notes, **or cellphones** are allowed.
- If you have a question, raise your hand, and a proctor will assist you.
- Do not attempt to communicate with anyone other than teaching staff during the exam. However, “thinking with your hands” is allowed.
- **You should make liberal use of the scratch paper provided to draw diagrams to help you reason.**

Good luck!

LAB SCHEDULE

Day	Time	Section	Instructor
Monday	8:00-9:20 AM	M024	Scott Bassler
Monday	9:30-10:50 AM	M003	Scott Bassler
Monday	11:00 AM - 12:20 PM	M004	Lindsay DeMarchi
Monday	12:45-2:05 PM	M005	Lindsay DeMarchi
Monday	2:15-3:35 PM	M006	Jiaxin Sun
Monday	3:45-5:05 PM	M007	Jiaxin Sun
Monday	5:15-6:35 PM	M008	Manu Mannattil
Monday	6:45-8:05 PM	M009	Manu Mannattil
Monday	8:15-9:35 PM	M010	Manu Mannattil
Tuesday	3:30-4:50 PM	M027	Scott Bassler
Tuesday	5:00-6:20 PM	M028	Scott Bassler
Tuesday	6:30-7:50 PM	M029	Ohana Benevides Rodrigues
Tuesday	8:00-9:20 PM	M030	Ohana Benevides Rodrigues
Wednesday	8:00-9:20 AM	M025	Manu Mannattil
Wednesday	9:30-10:50 AM	M011	Manu Mannattil
Wednesday	11:00 AM - 12:20 PM	M012	Ohana Benevides Rodrigues
Wednesday	12:45-2:05 PM	M013	Ohana Benevides Rodrigues
Wednesday	2:15-3:35 PM	M014	Ohana Benevides Rodrigues
Wednesday	3:45-5:05 PM	M015	Nouman Butt
Wednesday	5:15-6:35 PM	M016	Nouman Butt
Wednesday	6:45-8:05 PM	M017	Jiaxin Sun
Wednesday	8:15-9:35 PM	M018	Jiaxin Sun
Thursday	5:00-6:20 PM	M019	Lindsay DeMarchi
Thursday	6:30-7:50 PM	M020	Lindsay DeMarchi
Thursday	8:00-9:20 PM	M031	Lindsay DeMarchi
Friday	8:00-9:20 AM	M026	Nouman Butt
Friday	9:30-10:50 AM	M021	Nouman Butt
Friday	11:00 AM - 12:20 PM	M022	Nouman Butt
Friday	12:45-2:05 PM	M023	Jiaxin Sun

(Question axial-tilt-2)

1. If the angle of the Earth's axial tilt were increased from 23° to 30° , what would change?
 - (A) The size of the tropics would increase
 - (B) The days would be longer in July in Tierra del Fuego, Argentina (latitude 54° S)
 - (C) The size of the Arctic would increase
 - (D) Syracuse, New York (latitude 42° M) would experience more extreme winters
 - (E) **All of the above**

(Question zodiac)

2. Consider the following diagram:

In one month, which constellation will be behind the Sun?

- (A) Leo
- (B) **Virgo**
- (C) Cancer
- (D) Pisces
- (E) Capricornus

(Question celestial-sphere-equator)

3. Where would someone standing in Addis Ababa, Ethiopia (latitude 9° N) look to see the star Polaris?
- (A) High in the northern sky
 - (B) Right on the northern horizon
 - (C) At the zenith (highest point in the sky)
 - (D) Polaris is not visible from Addis Ababa
 - (E) **Very low in the northern sky**

(Question sidereal-3)

4. Suppose that you could see the Sun, the stars, the moon, and the planets all at the same time in the sky. You look up at the sky at noon and note where all these objects are. Exactly one sidereal day later, which of these objects will be *most nearly* in the same place?
- (A) The planet Venus
 - (B) **The stars**
 - (C) The Moon
 - (D) The Sun
 - (E) More than one of these objects will be exactly in the same place

(Question aldebaran-2)

5. You observe the star Aldebaran low in the eastern sky at midnight. Tomorrow at 11:56PM (that is, four minutes less than one day) you observe Aldebaran again. Will Aldebaran be in the same place? If not, how many degrees will Aldebaran appear to have moved?

The difference in length between a solar day and a sidereal day is four minutes.

- (A) It will have moved about one degree North
- (B) It will have moved about one degree lower in the sky
- (C) It will have moved about one degree higher in the sky
- (D) It will have moved about one degree South
- (E) **It will be in exactly the same place**

(Question suggest-6)

6. You point your left arm North, and point your other arm directly at the North Star. What is the angle between your two arms? *(Thanks to Zachary for the question!)*

Syracuse is located at 42° N latitude. The axial tilt of the Earth is about 23° degrees.

- (A) 67 degrees
- (B) 23 degrees
- (C) **42 degrees**
- (D) 0 degrees – your two arms are pointing in the same direction
- (E) 48 degrees

(Question seasons-severity)

7. Which place experiences greater variability between the seasons?

- (A) Hermosillo, Mexico (roughly 29° N)
- (B) **Nunavut, Canada (latitude 63° N)**
- (C) Beijing, China (roughly 40° N)
- (D) Cape Town, South Africa (latitude 33° S)
- (E) Nairobi, Kenya (roughly 1° S)

(Question polar-night)

8. If you are standing exactly on the Antarctic Circle, you will experience exactly one day of polar night each year – a day when the Sun does not rise above the horizon at all. This day is:

- (A) The December solstice
- (B) **The June solstice**
- (C) The September equinox
- (D) The March equinox
- (E) None of the above

(Question seasons-2)

9. In the diagram below, which letter corresponds to a location in the Southern Hemisphere during summer?

(Question moon-phase-daytime-2)

10. Which moon phase is visible mostly during the day?

- (A) Full
- (B) Half
- (C) Gibbous
- (D) **Crescent**
- (E) You can't see the Moon while the Sun is in the sky

(Question new-moon-phase)

11. A “new moon” is the phase of the lunar cycle when we can't see the Moon at all. Which is true during a new moon?

- (A) The Moon is below the horizon
- (B) The Earth's shadow falls on top of the Moon
- (C) **The sunlit half of the Moon is facing away from us**
- (D) None of the Moon's surface is illuminated by the Sun
- (E) None of the above

(Question south-pole-motion)

12. You look up at the night sky and see all of the stars rotating clockwise around the zenith (the point directly above your head). Where are you standing?
- (A) **At the South Pole**
 - (B) At the North Pole
 - (C) On the Equator
 - (D) Anywhere in the Southern Hemisphere
 - (E) This is possible at more than one of these places

(Question circumpolar-2)

13. Consider the star shown here:

(Both this star and Polaris are on the “background” of the image, in front of the observer.)

If it is 6PM in this picture, where will this star be at 6AM?

- (A) Low in the eastern sky
- (B) Low in the southern sky
- (C) **High in the sky, near the zenith**
- (D) Low in the northern sky
- (E) Low in the western sky

(Question celestial-sphere-2)

14. Which statement is incorrect about the celestial sphere model?

- (A) Since the Moon moves around the Earth in about thirty days, the Moon slips about $360^\circ/30 = 12^\circ$ degrees along the celestial sphere relative to the stars.
- (B) The celestial sphere model gives a very precise prediction of the apparent motion of the stars, because the Earth's relative motion compared to the distances to the stars is so small.
- (C) The celestial sphere model accounts for the apparent motion of the sky due to the rotation of the Earth.
- (D) **Since the Sun does not move, the Sun stays at a fixed position in the celestial sphere relative to the stars.**
- (E) All of the above are correct.

(Question description-2)

15. Consider the following star:

How would you describe this star's location at midnight?

- (A) At the zenith (the highest point of the sky)
- (B) High in the northwestern sky
- (C) **Low in the northern sky**
- (D) High in the northern sky
- (E) High in the northeastern sky

(Question light-travel)

16. About how long does it take light to travel to the nearest stars (other than the Sun)?

- (A) A few minutes
- (B) A few hundred milliseconds
- (C) **A few years**
- (D) Around a century
- (E) A few days

(Question directions-2)

17. Here is a diagram of the celestial sphere with directions labeled. The North Star is shown (at position 1).

Which is the correct labeling of the cardinal directions on this diagram?

- (A) **North is direction 6; South is direction 5; East is direction 3; West is direction 7**
- (B) North is direction 1; South is direction 4; East is direction 5; West is direction 6
- (C) North is direction 1; South is direction 4; East is direction 3; West is direction 7
- (D) North is direction 2; South is direction 8; East is direction 5; West is direction 6
- (E) All of the above are wrong

(Question seasons-causes)

18. Which of the following is *not* a reason that Syracuse is colder in January than in July?
- (A) Syracuse receives more direct sunlight in July than in January
 - (B) Syracuse receives more hours of sunlight each day in July than in January
 - (C) Syracuse is tilted toward the Sun in July and away from the Sun in January
 - (D) **Syracuse is closer to the sun in July**
 - (E) More than one of the above is not true

(Question wrong-season-causes)

19. Which observational fact refutes the idea that the distance from the Earth to the Sun causes the seasons?
- (A) The Earth is actually closest to the Sun in winter in Syracuse
 - (B) The Equator doesn't really experience either summer or winter
 - (C) The Northern and Southern Hemispheres experience opposite summer/winter
 - (D) The length of day and night changes between summer and winter
 - (E) **All of the above can be used to refute the misconception that the distance from the Earth to the Sun causes the seasons.**

(Question suggest-2)

20. How much of the Moon's total surface (not just the part we can see) is illuminated by the Sun during a gibbous moon? (*Thanks to Hope for the question!*)
- (A) More than half, but less than all of it
 - (B) None of it
 - (C) Some of it, but less than half
 - (D) All of it
 - (E) **Half of it**

(Question suggest-4)

21. Why does the Earth rotate slightly more than 360° in a solar day? (*Thanks to John for the question!*)
- (A) Because the Earth is tilted on its axis
 - (B) **Because the Earth slowly orbits around the Sun**
 - (C) Because the Earth rotates more slowly each day
 - (D) None of the above
 - (E) Because the Sun moves slightly each day

(Question sidereal-2)

22. Suppose that you could see the Sun, the stars, the moon, and the planets all at the same time in the sky. You look up at the sky at noon and note where all these objects are. Tomorrow at noon, which of these objects will be *most nearly* in the same place?
- (A) **The Sun**
 - (B) The planet Venus
 - (C) The Moon
 - (D) The stars
 - (E) More than one of these objects will be exactly in the same place

(Question moon-phases-cause)

23. Which is the correct explanation for the phases of the Moon?
- (A) **Half of the Moon is always sunlit, and we always can see half of the Moon, but those halves aren't always the same**
 - (B) All of the Moon is sunlit, but based on the position of the Moon relative to the Earth, sometimes we see more than half of the Moon, and sometimes we see less than half
 - (C) Sometimes the Moon is in the Earth's shadow, which blocks light from more or less of the Moon, depending on the position of the Earth
 - (D) Based on the position of the Moon relative to the Sun, sometimes more than half of the Moon is sunlit, and sometimes less than half of it is
 - (E) All of the above are incorrect

(Question moon-time-2)

24. You are traveling through the desert. Since it is so hot during the daytime, you would prefer to camp during the day and travel at night. However, it is too dark to travel when the Moon is not visible. Thus, you can only travel when the Moon is visible, but the Sun is not.

Suppose that the phase of the moon is third quarter – that is, a waning half moon. Approximately what times will you be able to travel tonight?

- (A) You won't be able to travel at all, and need to wait until the moon phase changes
- (B) All night long
- (C) From 6PM until midnight
- (D) **From midnight until 6AM**

(Question equator-motion)

25. When you look North, you see all the stars rotating counterclockwise around a point exactly on the horizon. When you look South, you see all the stars rotating clockwise around a point on the opposite horizon. Where are you standing?

- (A) Anywhere in the Southern Hemisphere
- (B) At the North Pole
- (C) **On the Equator**
- (D) At the South Pole
- (E) The motion described can't happen anywhere on Earth

(Question stop-orbit)

26. Suppose that the Earth did not revolve around the Sun, but simply stayed in one place and rotated on its axis. Which of the following would happen?

- (A) **The solar and sidereal days would be the same length**
- (B) We would no longer have day and night
- (C) The location of the North Celestial Pole in the sky would no longer depend on the observer's latitude
- (D) The celestial sphere would no longer rotate around the Earth
- (E) None of the above

(Question rise-east)

27. You are standing in Wellington, New Zealand (latitude 41° S), watching the night sky. You see a star rise directly on your eastern horizon. How does this star move?
- (A) It moves Northwest.
 - (B) It moves Southwest.
 - (C) **It moves upward and to the North.**
 - (D) It moves upward and to the South.
 - (E) Since New Zealand is in the Southern Hemisphere, the star wouldn't be rising in the East.

(Question distance-rank)

28. Which of the following gives the correct ranking of the distances of the following objects from Earth, from closest to furthest away?
- (A) Polaris; Moon; Sun; Saturn; the center of the Milky Way
 - (B) Sun; Moon; Polaris; the center of the Milky Way; Saturn
 - (C) Moon; Saturn; Sun; Polaris; the center of the Milky Way
 - (D) **Moon; Sun; Saturn; Polaris; the center of the Milky Way**
 - (E) None of the above

(Question dome2)

29. Consider the star shown here:

How long ago did this star rise?

- (A) Between twelve and twenty-four hours ago
- (B) **Within an hour ago**
- (C) Within twelve hours ago
- (D) Never; it is a circumpolar star
- (E) It depends on your latitude

(Question motion-sky)

30. Which statement correctly describes the motion of the stars in the sky each night?

- (A) All of the stars that we see are about the same distance away. They all appear to move together in the same way; their apparent motion is only because of our own rotation.
- (B) Different stars in the night sky seem to move at different rates based on how far they are away from Earth. Their apparent motion is due to the Earth's rotation; stars closer to Earth appear to move more quickly.
- (C) All of the stars are different distances from us, but all appear to move together in the same way. This is because the Earth's orbit around the Sun causes them to be in different spots in the sky relative to the horizon.
- (D) **All of the stars are different distances from us, but all appear to move together in the same way. This is because they are very far from Earth, much further away than the distance we move in a year, and their apparent motion is only because of our own rotation.**
- (E) None of the above are correct.
