The yearly motion of the sky

Astronomy 101 Syracuse University, Fall 2021 Walter Freeman

September 9, 2021

The Sun and the stars: the zodiac

This is the excellent foppery of the world, that, when we are sick in fortune, often the surfeit of our own behaviour, we make guilty of our disasters the sun, the moon, and the stars; as if we were villains on necessity; fools by heavenly compulsion... An admirable evasion of whore-master man, to lay his goatish disposition to the charge of a star!

—William Shakespeare, King Lear

For in that event [the stars dictated our fates], every single individual would lack the power to do anything he set his mind to, since something else draws him on – against his will – to be this and not to be that...

—Maimonides (c. 1135-1204), Spanish / North African Sephardic scholar

Announcements

I am way behind answering email. I'm catching up!

Announcements

- Paper 1 will be assigned next week
- The takehome labs will also be assigned next Tuesday

Announcements

- Paper 1 will be assigned next week
- The takehome labs will also be assigned next Tuesday
- What should you do if you must miss your lab?
 - $\bullet \ \ \text{If it's for a } good\ reason\ (\text{illness, emergency, academic/professional conflict, family commitment})...$
 - Look at the lab schedule and find another section/sections you might want to attend
 - Email or both your TA and the TA the other section
 - Tell them what is going on, and ask if there are any empty seats in their section
 - If both TA's approve the swap, attend the other section
 - We will take care of entering grades; it is your responsibility to get your work back from the other TA

Your first quiz is next Tuesday, during the last portion of class.

It will cover all material up to that point, including the things we do in class during the *first* portion of class and during Lab 1.

• It will be around 10 questions and will be multiple choice.

- There will be assigned seats for Tuesday's class. The seating chart will be on the wall as you come in.
- If you must miss class that day or would like to raise your score, you will have a second opportunity to take a quiz on this material two weeks later.

What kind of world is this? What can't you see?

Help sessions

Questions about the *Exercise-Tutorials?* Want to study with me? Come chat!

This is the absolute very best thing you can do to study for my class.

Come by the Clinic, Physics Building 112, and ask questions, or ask on Discord.

I also have office hours Wednesday 2-4 or Friday 9-11; come see me in room 215!

Today: consequences of the Earth's **revolution**:

- How is the Sun different from the other stars?
- What's this zodiac business?
- What does it mean for the Sun to be "in Aries"?

Today: consequences of the Earth's **revolution**:

- How is the Sun different from the other stars?
- What's this zodiac business?
- What does it mean for the Sun to be "in Aries"?
- We will see how this is only complicated because of how we keep time

The yearly motion of the sky

Which is true about the Sun?

A: The celestial sphere model predicts its motion exactly

B: The celestial sphere model predicts its daily motion, but isn't accurate for longer times

C: The celestial sphere model is completely wrong for the Sun

Why is the celestial sphere model a bit wrong for the Sun?

A: The Sun is close enough that the Earth's movement matters, unlike for other stars

B: The Sun lies on a different celestial sphere than the stars, which turns at a different rate

C: Angels push the Sun around on the celestial sphere, so it moves

D: The Sun is close enough that we notice its movement, unlike the other stars

Let's use *Stellarium* to revisit the same time every night – say, midnight.

Let's use Stellarium to revisit the same time every night – say, midnight.

... What's wrong?

Let's use *Stellarium* to revisit the same time every night – say, midnight.

... What's wrong?

... isn't the celestial sphere supposed to rotate once per day?

... Why are the stars moving?

... What's wrong?

Now let's look at the sky during the *daytime*, pretending the atmosphere is gone.

Now let's look at the sky during the *daytime*, pretending the atmosphere is gone.

Which moves more, the sun or the stars?

Now let's look at the sky during the *daytime*, pretending the atmosphere is gone.

Which moves more, the sun or the stars?

- The Sun just moves up and down a little bit, and the stars spin!
- ... why is this?

Let's try to understand this on paper.

Work through the *Tutorial-Exercise* for today. Your next homework is on the back; you can possibly finish it in class today.

We will talk about something else after this.

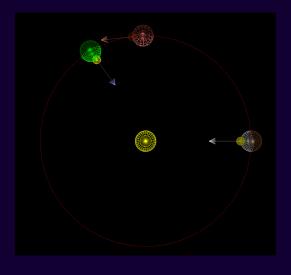

If the Earth is in the white position here, and the observer is the yellow dot (with the arrow sticking out of their head), what time is it?

A: Noon

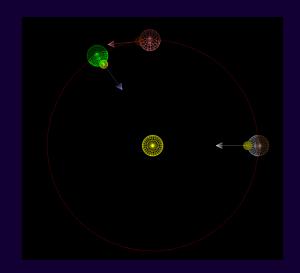

B: Midnight

C: Sunrise

D: Sunset

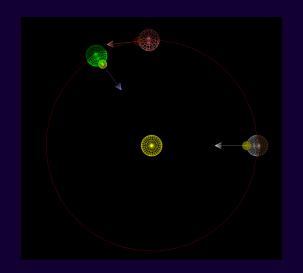

Which image shows the position of the Earth **exactly** one day later?

A: The red one

B: The green one

Which image shows the position of the Earth **exactly** one day later?

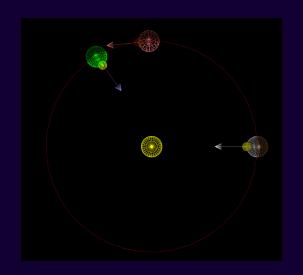

A: The red one

B: The green one

C: Depends on what you mean by "a day"

Which image shows the position of the Earth **exactly** one day later?

A: The red one

B: The green one

C: Depends on what you mean by "a day"

D: The Earth moves? BURN THE HERETIC!

There are two kinds of day!

- Solar day: judged by the position of the Sun
- Sidereal day (sih-dee-ree-al): judged only by the rotation of the Earth with respect to the stars
