The dream of flight / Il sogno di volare

Italian text: Leonardo da Vinci

Music by Christopher Tin

The Royal Philharmonic Orchestra, the Angel City Chorale, Prima Vocal Ensemble, and Lucis: London, July 2016

Una volta che avrai
spiccato il volo, deciderai
sguardo verso il ciel saprai:
lì a casa il cuore sentirai

Once you have taken flight
you'll decide
Gaze toward the sky: you'll know that
that is where your heart will feel at home

The dream of flight / Il sogno di volare

Italian text: Leonardo da Vinci

Music by Christopher Tin

The Royal Philharmonic Orchestra, the Angel City Chorale, Prima Vocal Ensemble, and Lucis: London, July 2016

Una volta che avrai
spiccato il volo, deciderai
sguardo verso il ciel saprai:
lì a casa il cuore sentirai

Prenaderá il primoro volo
verso il sole il grande uccello
sorvolando il grande monte cereri
riempendo l'universo di stupore e gloria.

Once you have taken flight
you'll decide
Gaze toward the sky: you'll know that
that is where your heart will feel at home

The first great bird
will take flight towards the sun,
sweeping over the great Mt. Ceceri,
filling the universe with wonder and glory.

Announcements

- Due dates for final project adjusted (in your favor)
 - Before 5PM, Monday December 5: +1 point
 - Before 5PM, Thursday December 8: +0.5 point
 - Before 5PM, Tuesday December 13: graded as normal
 - Before 5PM, Thursday December 15: -2 points, -5 if score less than 7/10
- Final projects may be turned in:
 - In my mailbox in the main office
 - In the box I have with me
 - (Starting next Monday) in a box by my office door
 - Final exam: 50% new material, 50% from exams 1-3
 - See my email for how to turn in fine-art type projects
- Take-home labs due in lab next week (hand them to your TA)

The victory lap

We've studied what's up there,
how it works, and how we see it.

The victory lap

We've studied what's up there,
how it works, and how we see it.

You've learned some chemistry,
some physics, some geology, some
geometry, and – yes – some math,
and I'm proud of you.

The victory lap

We've studied what's up there,
how it works, and how we see it.

You've learned some chemistry,
some physics, some geology, some
geometry, and – yes – some math,
and I'm proud of you.

Now, the question we've been
asking for a while: **Can we go
there? (and how do we get
there?)**

The victory lap

We've studied what's up there, how it works, and how we see it.

You've learned some chemistry, some physics, some geology, some geometry, and – yes – some math, and I'm proud of you.

Now, the question we've been asking for a while: **Can we go there? (and how do we get there?)**

The dream of flight

People have dreamed of flying for ages, in all countries and since the earliest days of history.

- Often our dream of flight was a symbol of hubris: “mortals should know their place”
- Icarus and Daedalus...

The dream of flight

People have dreamed of flying for ages, in all countries and since the earliest days of history.

Leonardo da Vinci (Italian, 1452-1519):

- Embodied the humanist spirit of the Renaissance: “yes, we *can!*”
- Skilled at science, philosophy, engineering, and art
- ... and used them all to enhance each other
- Like so many others, dreamed of flying...
- Was a Ninja Turtle, or my childhood was a lie

The “Renaissance man” (and woman!)

The Renaissance admired versatility; the “Renaissance man” was someone whose skill wasn’t confined to one field.

The “Renaissance man” (and woman!)

The Renaissance admired versatility; the “Renaissance man” was someone whose skill wasn’t confined to one field.

Science as a liberal art

There's a reason this class is in the “College of Arts and Sciences”.

Understanding the world around us was once “natural philosophy” – another branch of the unified whole of learning.

Some of you may go on to become doctors – not of physics or literature or engineering, but *philosophy*.

“Science” just means knowledge: *Suos cultores scientia coronat...*

It's not “science and the liberal arts” – science *is* a liberal art.

Science as a liberal art

Some of you may go on to become doctors – not of physics or literature or engineering, but *philosophy*.

“Science” just means knowledge: *Suos cultores scientia coronat...*

It's not “science and the liberal arts” – science *is* a liberal art.

When you can, be like da Vinci...

da Vinci and flight

da Vinci dreamed of flying, and wrote a treatise on birds – and made diagrams for flying machines.

Unfortunately, people don't just lack wings – they lack enough **power**.
(Human: 60 kg, 400 watts; duck, 1 kg, 100+ watts)

Power + wings = flight!

Push yourself forward, use wings to push downward on the air (flapping or not), and you can fly!

Power + wings = flight!

Push yourself forward, use wings to push downward on the air (flapping or not), and you can fly!

Well, not quite – you have to figure out how to *steer*, which is the hard part. (You push on the air...)

Power + wings = flight!

Push yourself forward, use wings to push downward on the air (flapping or not), and you can fly!

Well, not quite – you have to figure out how to *steer*, which is the hard part. (You push on the air...)

In 1903 Wilbur and Orville Wright put an internal combustion engine on a winged machine, put a propeller on the front, added devices to steer, and invented the airplane.

The dream of flight, in the waking world...

We can fly! Even before that, people were dreaming of going to the Moon and beyond.

- 1865: Verne wrote a book in which Baltimoreans shoot themselves to the Moon in a giant cannon
- Verne did the math for the size of the gun required and got it right
- It would have worked!
- ... the acceleration would have squashed the people, though...

A giant cannon won't work. Can we use Wilber and Orville's airplane to go to the Moon?

A: Yep!

B: Nope; it won't work at all

C: Sort of – you can propel yourself, but you can't steer

Newton's third law

Remember gravity?

$$F = \frac{Gm_1m_2}{r^2}$$

“The Sun’s pull on the Earth is the same as the Earth’s pull on the Sun”

Newton's third law

Remember gravity?

$$F = \frac{Gm_1m_2}{r^2}$$

“The Sun’s pull on the Earth is the same as the Earth’s pull on the Sun”

This is a general principle of physics:

“If A pushes forwards on B, then B must push backwards on A.”

How does a propeller work? “The airplane pushes backwards on the air; the air pushes forwards on the airplane”.

Newton's third law

Remember gravity?

$$F = \frac{Gm_1m_2}{r^2}$$

“The Sun’s pull on the Earth is the same as the Earth’s pull on the Sun”

This is a general principle of physics:

“If A pushes forwards on B, then B must push backwards on A.”

How does a propeller work? “The airplane pushes backwards on the air; the air pushes forwards on the airplane”.

“A spaceplane pushes backwards on the ... drat, there’s no air in space.”

Newton's third law

Remember gravity?

$$F = \frac{Gm_1m_2}{r^2}$$

“The Sun’s pull on the Earth is the same as the Earth’s pull on the Sun”

This is a general principle of physics:

“If A pushes forwards on B, then B must push backwards on A.”

How does a propeller work? “The airplane pushes backwards on the air; the air pushes forwards on the airplane”.

“A spaceplane pushes backwards on the ... drat, there’s no air in space.”

(Forget that “action/reaction” stuff – “action” meant something specific to Newton that it doesn’t mean today.)

Rockets

Simple solution: carry gas (or anything else) with you, and push it out the back!

The Chinese had been using rockets in warfare as early as 1280, using the gunpowder also developed in China.

The Koreans and Mongolians quickly adopted the new weapon, and the technology spread around Eurasia in the next few centuries.

This works in space: “I push backwards on the gas I’ve brought with me; it pushes forwards on me”

Tsiolkovsky: making rockets precise

The Russian scientist Konstantin Tsiolkovsky (1857-1935) was the first to study the physics of rocketry in depth. (He also studied music and the problem of poverty.)

He discovered the *rocket equation*, which describes the performance of a perfect, ideal rocket:

$$\Delta V = v_e \ln F$$

Here:

- ΔV is the speed that the rocket will be traveling after it burns its fuel
 - To escape Earth's gravity: about 11 kilometers/second (calculated by Tsiolkovsky)
- v_e is the exhaust velocity of the rocket (how fast the gas comes out the back)
- F is how many times bigger the rocket is than its payload
 - Here "payload" means every part of the rocket that isn't fuel

We can make the math easier and rearrange this:

$$F = (2.719)^{V/v_e}$$

or

$$F = 10^{0.43 \frac{V}{v_e}}$$

Tsiolkovsky: making rockets precise

Tsiolkovsky realized that rockets could take us to space, and wrote about this in 1903: “Exploration of Cosmic Space by Means of Rocket Devices”

But what kind of fuel is needed? Let’s make a table here. Suppose we want to lift a ton to orbit; how much fuel do we need?

Fuel exhaust speed	Fuel needed
1000 km/hr	300 million billion tons
2000 km/hr	5.5 million tons
3000 km/hr	680,000 tons
5000 km/hr	3100 tons
9000 km/hr (solid rockets)	87 tons
15400 km/hr (hydrogen/oxygen)	13 tons
104000 km/hr (ion thrusters)	470 kilograms

The problem with rockets: you have to carry your fuel with you. The less efficient your fuel is, the more fuel you need, so you need more fuel to carry that fuel...

And, if you want to come back from wherever you went, you need even *more* fuel...

Robert Goddard: making rockets

Robert Goddard (American; 1882-1945) had a long-running interest in rocketry as a means to get to space. He:

- took Tsiolkovsky's ideas and put them into practice
- realized that a specially-shaped rocket nozzle could greatly increase exhaust speeds (remember how much this matters!)
- achieved exhaust speeds of 8600 km/hr

Robert Goddard: making rockets

Robert Goddard (American; 1882-1945) had a long-running interest in rocketry as a means to get to space. He:

- took Tsiolkovsky's ideas and put them into practice
- realized that a specially-shaped rocket nozzle could greatly increase exhaust speeds (remember how much this matters!)
- achieved exhaust speeds of 8600 km/hr
- believed that a rocket could reach the Moon!

For the first time, we have a plan: a machine whose workings we understand that can get us to the Moon!

Not everyone was convinced.

[A]fter the rocket quits our air and really starts on its longer journey, its flight would be neither accelerated nor maintained by the explosion of the charges it then might have left. To claim that it would be is to deny a fundamental law of dynamics, and only Dr. Einstein and his chosen dozen, so few and fit, are licensed to do that.... That Professor Goddard, with his “chair” in Clark College and the countenancing of the Smithsonian Institution, does not know the relation of action and reaction [Newton’s third law], and of the need to have something better than a vacuum against which to [push] – to say that would be absurd. Of course he only seems to lack the knowledge ladled out daily in high schools.”

–The New York Times, 1920

Rockets as a weapon

Humanity's dream of flight to the Moon was interrupted by the Second World War, with rockets pressed into service to kill each other.

All sides in the war used rocket weapons, but the most famous and largest was the German V-2: <https://www.youtube.com/watch?v=94T8Vx00vdI>

These rockets, designed by a team of German engineers led by Werhner von Braun, were fired across the English Channel at London. They didn't do much damage, but were terrifying.

All sides in the war used rocket weapons, but the most famous and largest was the German V-2: <https://www.youtube.com/watch?v=94T8Vx00vdI>

These rockets, designed by a team of German engineers led by Werhner von Braun, were fired across the English Channel at London. They didn't do much damage, but were terrifying.

After WWII, the Cold War was on: the Americans and the Soviets thought it was just a matter of time until they were at war.

Both sides rushed to capture von Braun and his team; the Americans got there first, and brought them back to Alabama.

One of them lived across the street from me when I was a child. Another one was my high school English teacher.

The Cold War

Both Americans and Soviets lived in constant fear of nuclear war.

A rocket that could deliver a nuclear warhead was the ultimate weapon: an ICBM.

So rocket technology was key to “winning” the Cold War.

Both sides wanted to demonstrate their superiority. The Soviets, however, beat us: showing their mastery of the technology that could be used to kill tens of millions of Americans in a fraction of an hour.

Sputnik and Vostok

In 1957, the Soviets got there first, and launched the first satellite: Sputnik.

<https://www.youtube.com/watch?v=qvPzUAeWZZY>

Sputnik and Vostok

In 1957, the Soviets got there first, and launched the first satellite: Sputnik.

<https://www.youtube.com/watch?v=qvPzUAeWZZY>

This *terrified* the Americans: if you can put a satellite in orbit, you can get a thermonuclear bomb anywhere on Earth's surface. We created NASA in response and desperately tried to catch up, with a concentrated effort to recruit engineers and scientists to work on the project.

Sputnik and Vostok

In 1957, the Soviets got there first, and launched the first satellite: Sputnik.

<https://www.youtube.com/watch?v=qvPzUAeWZZY>

This *terrified* the Americans: if you can put a satellite in orbit, you can get a thermonuclear bomb anywhere on Earth's surface. We created NASA in response and desperately tried to catch up, with a concentrated effort to recruit engineers and scientists to work on the project.

Then in 1961 the Soviets launched a human to space, Yuri Gagarin, who orbited the Earth and returned safely.

The American response

In 1962 the American president John F. Kennedy called for a concentrated, devoted effort to travel to the Moon.

<https://www.youtube.com/watch?v=th5A6ZQ28pE> (excerpts – full text at
<http://bit.ly/2gB9L5q>)

The American response

In 1962 the American president John F. Kennedy called for a concentrated, devoted effort to travel to the Moon.

<https://www.youtube.com/watch?v=th5A6ZQ28pE> (excerpts – full text at <http://bit.ly/2gB9L5q>)

The effort took seven years. Before embarking on the mission to build the Moon rocket, we undertook two other flight programs:

- Project Mercury: small craft that carried one person, the first American in space Alan Shepard
- Project Gemini: two-person spacecraft in low-Earth orbit
 - Life support technology
 - Orbital maneuvering and docking
 - Extravehicular activity (“spacewalks”)

The Apollo program

NASA set out to build a large rocket, the Saturn V, that could reach the Moon.

- Three stages
- Designed to boost two spacecraft to the Moon
- ... a command module, designed to stay in lunar orbit
- ... and a lunar module, designed to land on the Moon itself

The Apollo program

NASA set out to build a large rocket, the Saturn V, that could reach the Moon.

- Three stages
- Designed to boost two spacecraft to the Moon
- ... a command module, designed to stay in lunar orbit
- ... and a lunar module, designed to land on the Moon itself

<https://xkcd.com/1133/>

The first few flights

- Apollo I (1967): crew chamber pressurized with pure O_2
- Caught fire; all three astronauts died – Chaffee, White, and Grissom.
- Seven flights in 1967-1969 tested various pieces of the equipment
- Apollo 8 and 10 sent astronauts to orbit the Moon itself, but they didn't land
- Massive engineering challenges required the invention of totally new fields

Of course he only seems to lack the knowledge ladled out daily in high schools.”

– The New York Times, 1920

“Further investigation and experimentation have confirmed the findings of Isaac Newton in the 17th Century and it is now definitely established that a rocket can function in a vacuum as well as in an atmosphere. The Times regrets the error.”

– The New York Times, 1969

Apollo 11: the Moon, at last!

On 20 July, 1969, humanity walked on another world for the first time.

- Neil Armstrong and Buzz Aldrin descended to the lunar surface
- Michael Collins stayed in lunar orbit in the Command Module
- They stayed on the Moon for nearly a day, walking on the surface for two and a half hours
- They brought back around fifty pounds of moon-rocks
- Gallery of images:
http://www.hq.nasa.gov/alsj/a11/a11_eva_thumbs.html

The remainder of Apollo

- The USA launched seven more *Apollo* missions to the Moon.
- Six of them made it; one, *Apollo 13*, suffered from an explosion en route.
 - Its story was made into a wonderful film of the same name
- 800+ pounds of moon rocks returned to Earth
- Dozens of hours spent on the lunar surface

Forgotten weapons into long-remembered stories...

Earth seen from lunar orbit, *Apollo 8* (December 1968)
